CERTIFICATIONS

AWS Certified Solutions Architect – Associate (SAA-C03) | CompTIA Security+ | Docker Foundations Professional Certificate | Google IT Support Professional Certificate

TECHNICAL SKILLS

AWS: Lambda, API Gateway, Step Functions, S3, DynamoDB, SQS, SNS, CloudWatch, IAM, VPC, SSM Parameter Store
Infrastructure as code: AWS SAM, CloudFormation, Terraform, Docker, GitHub Actions
Security & networking: Least-privilege IAM, VPC and subnet design, security groups, secrets in SSM, TCP/IP, DNS
Reliability: CloudWatch logs and alarms, dead-letter queues, retries with backoff, budget alarms
Languages: TypeScript, JavaScript, Node.js, Python, Bash, SQL, PostgreSQL

EXPERIENCE

Technical Consultant — Sep 2025 – Present

Independent (NDA client engagements) · Contract Full-time, Toronto, ON · Hybrid

- Cut a client's monthly cloud spend by about 25% by right-sizing resources and moving cold data to cheaper S3 storage tiers.
- Moved 10TB+ of business data into S3 with lifecycle rules and a documented recovery process; nothing lost.
- Segmented VPCs and scoped IAM so sensitive client data stayed isolated (NDA).
- Stood up cloud workspaces and wrote runbooks so the client could operate the account without leftover standing access.

AWS Cloud Associate — Nov 2024 – Aug 2025

Amazon Web Services (AWS) · Contract Full-time, Toronto, ON · Remote

- Hosted and operated TypeScript, Node.js, and React applications on AWS, including the IAM and networking needed to keep them running.
- Scoped IAM so each app had one role, real resource ARNs, and no long-lived access keys in the environment.
- Defined the stack in SAM, CloudFormation, or Terraform so the environment could be rebuilt from the repo.
- Wired CloudWatch logs, metrics, and budget alarms so outages and spend spikes showed up as email instead of a surprise.

Full Stack Engineer — Jan 2023 – May 2024

Contractor · Contract Part-time, Toronto, ON · Hybrid

- Built and shipped applications in TypeScript, Node.js, React, and PostgreSQL.
- Designed REST APIs and relational/NoSQL schemas.
- Implemented authentication and fixed issues when they broke in production.

PROJECTS

NimbusFlow — Serverless Event-Driven Data Pipeline on AWS — 2026

AWS SAM, Lambda, API Gateway, Step Functions, DynamoDB, SQS, SNS, CloudWatch, IAM, TypeScript

- Built a serverless event pipeline — API Gateway into Lambda, onto SQS, through Step Functions, into DynamoDB, out to SNS — with the stack, IAM, and alarms in one AWS SAM template.
- Wrote seven TypeScript Lambdas and validated payloads at the API edge so a malformed request returns 400 instead of clogging the queue.
- Put SQS and a dead-letter queue between ingest and processing, and gave every Step Functions state retries and a catch so failures are emailed instead of dropped.
- Gave each Lambda its own IAM role with real resource ARNs instead of wildcards, plus JSON logging and CloudWatch alarms on function errors and DLQ depth.

AWS CSPM — Account Posture Checks as Code — 2026

Terraform, Lambda, EventBridge, SNS, CloudWatch, IAM

- Built a scheduled Lambda that checks for public S3, missing encryption, IAM keys older than 90 days, and SSH/RDP open to the world, then emails findings over SNS.
- Scoped a single scan role, skipped AWS Config, and kept idle cost at effectively $0.
